

- 1) Now consider the opposite problem: using an encryption algorithm to construct a one-way hash function. Consider using RSA with a known key. Then process a message consisting of a sequence of blocks as follows: Encrypt the first block, XOR the result with the second block and encrypt again, etc. Show that this scheme is not secure by solving the following problem.

Given a two-block message  $B_1, B_2$ , and its hash

$$\text{RSAH}(B_1, B_2) = \text{RSA}(\text{RSA}(B_1) \oplus B_2)$$

Given an arbitrary block  $C_1$ , choose  $C_2$  so that  $\text{RSAH}(C_1, C_2) = \text{RSAH}(B_1, B_2)$ .

Thus, the hash function does not satisfy weak collision resistance.

Answer.

$$\begin{aligned} \text{RSAH}(C_1, C_2) &= \text{RSA}(\text{RSA}(C_1) \oplus C_2) \\ &= \text{RSA}(\text{RSA}(C_1) \oplus \text{RSA}(C_1) \oplus \text{RSA}(B_1) \oplus B_2) \\ &= \text{RSA}(\text{RSA}(B_1) \oplus B_2) \\ &= \text{RSA}(B_1, B_2) \end{aligned}$$

Therefore, choose  $C_2 = \text{RSA}(C_1) \oplus \text{RSA}(B_1) \oplus B_2$

- 2) DSA specifies that if the signature generation process results in a value of  $s = 0$ , a new value of  $k$  should be generated and the signature should be recalculated.

Why?

Answer.

A user who produces a signature with  $s = 0$  is inadvertently revealing his or her private key  $d$  via the relationship:

$$s = 0 = k^{-1}[H(m) + dr] \bmod q$$

$$d = \frac{-H(m)}{r} \bmod q$$

- 3) Compute the signature of  $M = \text{"Hello!"}$  using the specified methods, where  $H(W) = \text{last 4 bits of SHA256}(W)$  for a binary string  $W$ . Also, compute the corresponding public keys and verify correctness of the signatures.

$$H(W) = \text{SHA256}(W) = 7 = m$$

- a) RSA:  $n = 323 = 17 \times 19$ ,  $PR = (323, 7^{-1} \bmod 288)$ .

$$PU = (d, n) = (7, 323)$$

$$\text{Sign} : S = m^d \bmod n = H(W)^{247} \bmod 323 = 216$$

$$\text{Verify} : (H(W), S^e \bmod n)$$

$$216^7 \bmod 323 = 7 = H(W) \rightarrow \text{Pass} \circ$$

- b) ElGamal:  $q = 103$ ,  $\alpha = 11$ ,  $X_A = 35$ .

$$PR = (q, \alpha, X_A) = (103, 11, 35)$$

$$Y_A = \alpha^{X_A} \bmod q = 11^{35} \bmod 103 = 101$$

$$PU = (q, \alpha, Y_A) = (103, 11, 101)$$

Sign :

Random choose  $k=3$  ,  $1 < k < q$  ,  $\gcd(k, q-1)=1$

$$S_1 = \alpha^k \bmod q = 11^3 \bmod 103 = 62$$

$$S_2 = k^{-1}(m - X_A S_1) \bmod (q-1) = 5^{-1}(7 - 35 \cdot 62) \bmod (102) = 57$$

Verify:  $(\alpha^m \bmod q, Y_A^{S_1} S_1^{S_2} \bmod q)$

$$\alpha^m = 11^7 = 86 = 101^{62} \times 62^{57} \bmod 103 \text{ } \circ \text{ Pass } \circ$$

c) Schnorr:  $p=103, q=17, a=72, PR = (103, 17, 72, 10)$

$$v = a^{-s} \bmod p = 72^{-10} \bmod 103 = 66$$

$$PU = (p, q, a, v) = (103, 17, 72, 66)$$

Sign:

$$x = a^r \bmod p = 72^2 \bmod 103 = 34$$

$$e = H(M || X) = 14$$

$$y = (r + se) \bmod q = (2 + 10 \times 14) \bmod 17 = 6$$

Verify :  $(a^y v^e \bmod p, x)$

$$a^y v^e \bmod p = 72^6 66^{14} \bmod 103 = 34 = x \text{ } \circ \text{ Pass }$$

d) DSA:  $p=103, q=17, g=72, PR = (103, 17, 72, 7)$

Random choose  $k=3$

$$y = (g^k \bmod p) = 66$$

$$PU = (p, q, g, y) = (103, 17, 72, 66)$$

Sign:

$$r = (g^k \bmod p) \bmod q = (72^3 \bmod 103) \bmod 17 = 11$$

$$s = k^{-1} (H(m) + xr) \bmod q = 11$$

Verify:  $(r, ((g^{H(m)} y^r)^{(s^{-1} \bmod q)} \bmod p) \bmod q)$

$$((g^{H(m)} y^r)^{(s^{-1} \bmod q)} \bmod p) \bmod q = (72^7 66^{11})^{14} \bmod 103 \bmod 17 = 11 = r \text{ } \circ \text{ Pass } \circ$$

4) Use the DFT method to factor  $M=77$  by choosing  $a=8, m=7, n=12$ . Use a tool, such as Matlab, to compute DFT. You need to show all steps of computation.

Step: 1.

Prepare a vector  $x = [0 \ 1 \ 2 \ \dots \ 2^{2m} - 1]$  .

Step: 2.

Compute  $g_{a,M}(x)$

$$= [a^0 \bmod M, a^1 \bmod M, a^2 \bmod M, \dots, a^{2^{14}-1} \bmod M]$$

$$= [1, 8, 64, 50, 15, 43, \dots]$$

Step: 3.

Compute and normalize  $f = DFT(g_{a,M}(x))$

$$f \approx [0.14, 0, 0, 0, \dots], f[410] \approx 0.0167, f[819] \approx 0.0439, f[1229] \approx 0.0240 \text{ } \circ$$

$$D = [0, 410, 819, 1229, 1638, 2458, 2867, 3277, 3686]$$

Step: 4.

Use “continued fraction” method to compute  $z_1, z_2, \dots, z_r$  of denominators at most  $n$ -bit long for approximating  $d_1/N, d_2/N, \dots, d_r/N$  within  $1/2N$  ◦

$$d_1/N = 410/4096 = 0.10009765625 \approx 1/10 \text{ ◦}$$

$$\therefore \text{ period } s = 10 \text{ ◦ } (a^s \bmod M = 1)$$

Step: 5.

$S$  is even and  $a^{s/2} \bmod M \neq \pm 1$  , then  $\gcd(a^{s/2} \pm 1, M) = p$  or  $q$  ◦

$$\gcd(a^5 + 1, M) = \gcd(44, 77) = 11$$

$$\gcd(a^5 - 1, M) = \gcd(42, 77) = 7$$

$$\therefore M = 11 \times 7$$
